DETAILED ACTION

Allowable Subject Matter

1. Claims 1, 4-6, 8, 9, 16, 20, 22-24 are allowed.

The following is an examiner's statement of reasons for allowance:

Doane (USPAP. 2002/0138226) discloses a software load tester, and a method of software load testing, are disclosed. The load tester includes a remote access connection to at least one provider, wherein the remote access connection is accessible to at least one remote user and to at least one remote site, a plurality of load test resources resident at the at least one provider, and at least one account recorder that governs access by the at least one user to said plurality of load test resources, such as by requiring username, a password, an account code, an encryption key, or cookies. The method includes the steps of remotely connecting at least one provider to at least one remote user and to at least one remote site, providing a plurality of load test resources resident at the at least one provider, governing access by the at least one user to the plurality of load test resources, and load testing the at least one remote site upon receipt of a direction to load test from the at least one remote user granted access according to the governing of access [see Doane: Abstract; Paragraphs [0032], [0042], [0057], [0063]-[0065]].

Regarding claim 1, the closest prior art (Doane) fails to anticipate or render obvious the combination wherein "one or more load simulators dynamically randomly generates user characteristics for a request based on percentage weightings statistically designate distribution of user characteristics as a percentage of total

requests sent to the server such that whereas each request is individually generated randomly, as the number of iterations increases, the load simulator generates a totality of requests that statistically corresponds to the weightings in the profile characteristics data store, a load coordinator component that dynamically evaluates the current distribution of the test load relative to a desired test load and adjusts the intensity and distribution of the requests, including increasing the requests per second to a predetermined level; and a performance monitor component that monitors performance of the server as the rate of requests is increased, so the load capacity of the server can be determined" in combination with other limitations in the claims as defined by Applicant.

Claims 4-6, 8, 9 and 22 depend from allowed claim 1 and therefore are also allowed.

Regarding claim 16, the closest prior art (Doane) fails to anticipate or render obvious the combination wherein "the percentage weightings are statistically parameters that designated distribution of user characteristics as a percentage of total requests, such that whereas each request is generated randomly, as the number of iteration increases, the load simulator generates a totality of requests with user characteristics that statistically correspond to the weightings in the profile characteristic data store; and dynamically evaluating, upon ending the iteration of the test load, the current test load relative to a desired test load and adjusting the intensity and distribution of the requests, including one of either creating a new request if the desired load is greater than the current load, or reducing the current test load by one if the

current load rises above the desired load" in combination with other limitations in the claims as defined by Applicant.

Claims 20 and 23 depend from allowed claim 16 and therefore are also allowed.

Regarding claim 24, the closest prior art (Doane) fails to anticipate or render obvious the combination wherein " a queuing mechanism that retrieves data from the data store based on a received signal input from the scheduler and places the request data in a queue and sorts requests within the queue according to a predetermined time function for execution, wherein the retrieved request data is randomly selected based on the weighted user characteristics; a sending component that reads and sends a sorted request from the queue upon receiving an input from the scheduler based upon a rate determined by the scheduler in order to provide a desired RPS; a feedback loop which provides closed loop control to enable the system to provide a continual and sustained rate of requests, wherein the feedback loop provides an input to the scheduler that is calculated based on the difference between an actual RPS and a target RPS, wherein the scheduler, based on the input, adjusts the rate of requests according to the target RPS" in combination with other limitations in the claims as defined by Applicant.

Conclusion

2. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
